

# Southworth Worker Platform

Southworth offers custom-configured lifts that can be designed into most production lines. We manufacture Elevating Worker Platforms for assembly or maintenance operations where large structures, such as aircraft or heavy equipment, must be accessed at varying heights. These lifts offer more flexibility and safety than scaffolding or ladders. Elevating worker platforms are also appropriate for stock picking from higher shelves, such as the vertically stacked compartments of storage carousels. With the industry's largest, most experienced engineering staff, Southworth designs stable scissor lifts in stationary or movable configurations and in a multitude of platform sizes and lifting ranges. We work with the customer to accommodate budgetary limitations as well as unique, application-specific requirements.

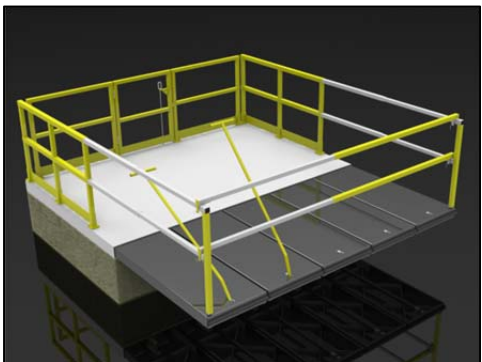

**MULTI-LIFT PLATFORM:** This platform is designed to travel up and down while carrying workers and several smaller lifts. Workers position the main lift at the appropriate height to access parts and material stock. Once items have been picked, they are placed on the smaller lifts so workers can position them at a comfortable height for assembly and packaging.

#### Special Features:

- Custom-built round platform power traverse lifts that interface with main platform lift via rounded cutouts.
- Four 2,000 lb capacity worker lifts.
- Custom retractable hand rails.
- Non-skid anti-static platform surface.
- Complete bellows skirting.

**HEAVY EQUIPMENT ASSEMBLY:** This platform is designed to provide workers with convenient access to all sides of construction equipment during the assemble process. Its U-Shaped configuration allows multiple workers to access different areas of equipment at the same time.

#### Special Features:

- Sliding Bridge Plates
- Anti-Static Decking
- Removable Swing Out Gates
